

Hey Kay,

How are you doing? Heard you're diving into API choices for the data project. I can give you some advice about choosing a API for your data project. sticking with what you know might make things smoother, likely boosting your grade. But, consider the perks of trying a new programming language ,it might be a bit more challenging now, but super handy in the future. It's not only for your project but also shows your willingness to learn something new.

How about a mix if it's possible? Use the familiar for the main stuff, and set aside some project time to dip into the new language. I don't have much knowledge about APIs, but maybe this is an option.

If you need some more advice you can ask my.

Cheers,

Kjeld
