

Hallo everyone,

I am writing this email because there is some confusion about last Monday's meeting. In that discussion, several points were raised. I want to create a list of these points for everyone, so we have everything clearly organized for future discussions. This way, we can read this mail again if we forget something.

It was mentioned that a webcam needs to be present at the weather station of NHL Stenden Emmen. This webcam has to show the surroundings of the school building. In order to complete this, we need to buy a webcam.

when we look to the next point, we need a backup system. 2 Raspberry Pi's are the best option. There is an alternative, but it is more expensive.

There are a number of sensors. My colleague has found a good sensor for a good price. However, there are also several issues. The code sends the wrong raw data to the Raspberry Pi's. Could we make an appointment to discuss these matters?

The Raspberry Pi also lost the network connection. This has to do with the laptop that functions as a router.

The last point, can we make some sort of box to protect our sensors? At this stage, everything can be better organized.

I hope to hear from you.

Kjeld Heemskerk
